

MLFF Architecture Revision 70 - TARGET-DATA2C-REPAIR1

Release: mdstats 0.20.203a0

Date: 2026-08-16

Dependency-graph schema: 52

Revision 70 implements TARGET-DATA2C-REPAIR1 as diagnostic/pre-migration scientific selection-repair evidence. The gate performs exact coverage-multiplicity unique-contribution accounting, hard-obligation-safe active-shell removal, deficit-directed replacement, strict lexicographic improvement, and replacement-rank inheritance while keeping lower MVSEL1 prefixes immutable.

The MVSEL1 reconstructible obligation state now retains exact selected multiplicities beyond the minimum required count. That state correction does not change MVSEL1 ordering; it enables exact removal safety without rescanning selected sets. prepare records `target_multi_view_repair` after MVSEL1 and before the unchanged revision-64 TARGET-DATA2C v4 authority.

Production target selection, DATA8 membership, CuEq TRAIN2 policy, and generated defaults remain unchanged.

Next gate: TARGET-DATA2C-MVPERF1.
