

mdstats 0.20.196a0 - FOUNDATION-AUDIT1 configuration hotfix

Fixed

A workstation prepare run could complete DATA6 recovery and then fail at the start of FOUNDATION-AUDIT1 with:

```
NameError: name 'cfg' is not defined
```

`_ensure_foundation_target_audit()` reads `performance.foundation_audit_temporary_ram_mib`, but the helper did not receive the campaign configuration. The function now takes `cfg` explicitly and `_prepare_materialization()` passes the active campaign configuration.

Scientific impact

None. The exception occurred before `build_foundation_target_audit()` was called. FOUNDATION-AUDIT1 definitions and all upstream DATA6/source/TRAIN2 identities are unchanged. Existing valid DATA6 artifacts remain reusable, so the same prepare command may be rerun without deleting the workspace.

Regression

A new helper-level regression uses `foundation_audit_temporary_ram_mib = 321` and verifies that exactly `321 * 1024**2` bytes are passed to the audit builder. The release hardening sweep also checks for other top-level `campaign_cli.py` helpers that read an unbound `cfg`; none remain.
