

mdstats 0.20.202a0 patch notes

This release implements **TARGET-DATA2C-MVSEL1** (architecture revision 69 / graph schema 51) as diagnostic/pre-migration evidence. The selector uses exact MVIDX1 sparse adjacency, required hard-obligation-first selection, current-worst-view coverage improvement, FP64 newly covered mass, least-selected correlation-unit balance, and a harmonic witness-multiplicity representative objective after hard coverage closes. Incremental gain caches are reconstructible and are not scientific authority.

prepare now records `target_multi_view_selection` before building the unchanged revision-64 TARGET-DATA2C v4 ladder. No DATA8 membership, target-size learning authority, CuEq policy, or generated default changes in this release.
